Dear Sir/Madam

Carbon Footprint Ltd has worked with A2C Services Ltd (t/a Circular Computing) to assess the business's Greenhouse Gas (GHG) emissions, following ISO 14064 part 1 and the GHG Protocol methodologies.

I can confirm that companies are able to report the CO₂e savings that have resulted from their purchase of Circular Computing laptops. The CO₂e savings come under your Scope 3 "purchased materials" and the associated GHG emissions would be net-zero.

An appropriate statement in your CSR reporting may read as follows.

"Due to purchasing re-manufactured laptops from Circular Computing, we avoid the generation of approximately 316 kgCO₂e per laptop (if bought new, made from virgin materials). The laptops we purchase from Circular Computing have net-zero greenhouse gas emissions associated with them as Circular Computing uses high-quality carbon offset projects to offset the emissions associated with the re-manufacturing operations. In addition to this, the reuse of precious resources in electrical and electronic equipment reduces the need for mining and the associated environmental and social impacts this causes. During this reporting period a total of <Insert QTY> Circular Computing laptops were purchased which have avoided approximately '<Insert total QTY X 316 kgCO₂e'> from being emitted into the atmosphere.

For further information please see www.circularcomputing.com"

Yours sincerely,

Dr. Wendy Buckley
